ABSTRACT: Predictive maintenance techniques are helping power plants operate more cost-effectively by improving plant performance and maximizing equipment lifecycles. In concept, predictive maintenance, also known as condition-based maintenance, is simple. It is looking at the condition of plant equipment and assessing its needs while it is in place and working. It is fixing only what needs fixing, overhauling only the parts that are failing, and deferring maintenance as long as possible when analysis shows the equipment is healthy. It is accomplished with sophisticated equipment. Its use in the utility industry has been growing by leaps and bounds in recent years.
